Let's break down the downloads for the program month by month.
In the first month, the program had 60 downloads.
In the second month, the program had three times as many as the downloads in the first month, so it had $60 * 3 = 180$ downloads.
In the third month, the downloads were reduced by 30%, which means it had $180 - (180 * 30 / 100) = 180 - 54 = 126$ downloads.
To find the total number of downloads over the three months, we add up the downloads from each month: $60 + 180 + 126 = 240 + 126 = 366$
Thus, the program had a total of $\boxed{366}$ downloads over the three months.
